*Mobile Fuel Spill*

*Cockpit Mock-Up*

*Thruster Fire*

## Mobile Aircraft FIRETRAINER® MA-500 VF (Vigili Fuoco)

This transportable aircraft trainer is a complete new development of KFT Fire Trainer (Patent pending). It was developed for high realistic replication of the inner and outer appearance of a Boeing 737 aircraft.

This FireTrainer® can be split into four 40' ISO containers for transport. Its wing section, engine, undercarriage and cockpit can be disassembled for storage within these containers so that the whole trainer can be transported on four standard trucks.

The realistically equipped interior of the trainer is meant for "hot" Search & Rescue Training mainly. Thus the interior houses two high performance radiant heaters and smoke machines.

The trainer also comes with three external fire places: Besides a mobile Fuel Spill with several independent burn zones, the trainer comprises an undercarriage fire, a thruster/jet engine fire and an engine maintenance panel fire.

**Delivered:** April 2012

**Fueled by:** Propane
